ARAZVERA TECHNOLOGIES

Secure Python Systems | Reliable APIs | Evidence-Driven Engineering

Client-facing engineering profile — 11 November 2026, strengthened edition (V2)
Technical scope: Python, FastAPI, PostgreSQL, SQLite, Docker, GitHub Actions, API integrations, operational recovery, and controlled AI-agent tooling
Contact: contact.arazvera@gmail.com · **Public work:** Engineering portfolio

Engineering that addresses real failure modes

We build **bounded, testable software components** for teams that need an API they can trust, an integration that survives retries, or a workflow with traceable decisions. Our approach starts from the failure case and written acceptance criteria—not a generic AI demonstration.

Typical problems we can scope:

- **Unreliable webhooks or background jobs:** signed ingress, idempotent processing, retries, dead-letter review, restart recovery.
- **Data integrity and access boundaries:** transactional imports, tenant-aware authorization, PostgreSQL RLS/role tests, safe rollback.
- **Unsafe changes and weak recovery evidence:** deployment HOLD/rollback rehearsal, observability checks, worker and database restore exercises.
- **Uncontrolled agent-tool access:** deny-by-default policies, human approval, budgets, allowlisted actions, evidence logs.
- **Inconsistent supplier or governance records:** deterministic data checks, exception reports, manual review and approved export.

What a customer receives under an agreed scope

1. **Written technical design** — inputs, data boundaries, exclusions, risks and acceptance conditions.
2. **Implementation or adaptation** — a narrowly defined module, API, integration, validator or test harness.
3. **Reproducible evidence** — automated tests, negative-path scenarios and a results record.
4. **Operational handover** — configuration guide, deployment/staging checklist, logs or runbook as applicable.
5. **Explicit remaining work** — environment-specific tasks, licensing, threat review and acceptance decisions.

The exact deliverables, source ownership, timelines and support are set in the contract. Nothing implies unrestricted source transfer.

Selected engineering evidence

Proof area	What has been demonstrated	Evidence boundary
Public Python/API cases	**9 synthetic runnable projects; 75 automated tests**, including PostgreSQL RLS, JWT-authenticated API, webhook recovery and transactional import	Public code, tests and CI; not customer production
Level 1–2 starter engineering	Private Level 1 historical baseline: **172 tests**; separate Level 2 private lab: **313 tests**	Different private test scopes; not additive certification
Level 3–4 reliability	**10 private specialist repositories** with recorded CI success; Level 4 synthetic resilience lab: **129 local tests**	Controlled laboratory only

Level 5 agent governance	**13 registered private SKU entries** (11 independent foundations + 2 composites); **158 distinct local tests**, hosted CI record	No independent enterprise security accreditation
Level 6 industrial evidence	**3 synthetic pilot families; 146 documented local tests** in the latest scope	No regulatory certification or live official filing
Level 7 customer-adaptable products	**3 product families; 82 local tests, 71 clean-extraction retests, 4 hosted CI jobs**	No buyer acceptance or operational production claim

Public samples: PostgreSQL RLS/restore · Authenticated API · Recoverable webhooks · Transactional import · GitHub Actions.

Services from focused fixes to advanced pilots

- **Level 1–2 — Focused Python and backend delivery:** bug repair, data scripts, FastAPI endpoints, authorized API adapters, transactional workflows, Docker/CI.
- **Level 3–4 — Reliability and resilience engineering:** tenant isolation, durable processing, identity validation, incident evidence, controlled releases and recovery rehearsals.
- **Level 5 — Agent security and governance:** scoped tool permissions, human approval, spend limits, reviewable audit records and restricted action gateways.
- **Level 6 — Industrial evidence preflight:** supplier record consistency, incident-report rehearsal, ICT-provider record quality tests.
- **Level 7 — Adaptable product modules:** supplier evidence contracts, allowlisted agent-action controls, and multi-SQLite recovery evidence.

Practical collaboration model

Discovery in written English → fixed or milestone-scoped proposal → isolated demonstration → authorized client adaptation → staging/security checks → agreed handover.

To request a proposal, email **contact.arazvera@gmail.com** with: (1) the business problem, (2) the system/stack, (3) sample or redacted inputs and expected output, (4) access/API and hosting constraints, and (5) acceptance criteria and timing. Do **not** email passwords, API secrets or customer personal data.

Claims and delivery boundaries

The portfolio documents **laboratory-tested capabilities**, not completed customer deployments, independent accreditations, endorsements, guaranteed uptime, or universal production readiness. Level 1–7 are internal service categories, not professional certifications. Client-owned server, approved APIs, credentials and licenses are required for integration; additional engineering, security review and real-environment acceptance may be substantial. Private source is not published. The freelance portfolio remains entirely separate from **AERON** and unrelated Iran-focused projects.

The engineering owner operates in Iran. Any engagement requires lawful contracting, applicable sanctions/export review, IP/licensing review, privacy/data safeguards and lawful payment arrangements. Communication is **asynchronous written English**.
