ARAZVERA TECHNOLOGIES

Yashar Rastgookhiavi | Engineering Contractor

Python / FastAPI • API Integration • n8n Workflows • Secure Automation • Docker & CI

Remote international collaboration | contact.arazvera@gmail.com | GitHub Organization

PROFILE

Independent engineering practice building testable backend services, API integrations, deterministic automations and reproducible delivery kits. Experience described here is based on private engineering prototypes and isolated synthetic tests, not claimed customer production deployments or an external qualification.

VERIFIED LEVEL 1 ENGINEERING BASELINE

Private FastAPI Starter | 16 pytest passes; API and backend acceptance baseline.

Private Kit Manager | 25 pytest passes; isolated project generation and recovery tooling.

Private n8n Automation Kit | 118 pytest passes; inactive workflow-only artifacts, guarded retries and client-safe templates.

Private Text Assistant Kit | 13 pytest passes; secure text automation baseline.

Evidence total: 172 passing tests across four restored private repositories. Each repository passed an isolated recovery and automated test run. Results are development/test-environment evidence, not security certification or commercial uptime validation.

REAL WORKFLOW DEMONSTRATION

Isolated local n8n → FastAPI lead-intake demonstration, recorded from real editor execution. Synthetic HTTP scenarios: created (201), duplicate (200), validation failure (422), manual review (202) and controlled failure (503). A two-minute video exists in a private review area; no public-viewing link has been verified. The vendor runtime was not approved for customer production.

DELIVERY CAPABILITIES

FastAPI and Python REST interfaces, webhook contract checks, defensive validation, idempotent request handling, synthetic integration tests, documentation, client-specific scaffolding, private Git recovery and reproducible CI evidence.

ENGAGEMENT BOUNDARY & CONTACT

Available for scoped remote consulting and customer-owned integrations. Customer infrastructure, API accounts and deployment authorization remain under customer control. Commercial terms including lawful USDT settlement can be discussed subject to platform policies and applicable rules.

n8n deployment limitation: official self-hosted engine candidate has unresolved security acceptance blockers; experimental patched images are not approved for commercial deployment. Client-owned n8n Cloud workflow handoff is a separate option requiring authorized tenant access and live validation.
