# YASHAR RASTGOO | ARAZVERA TECHNOLOGIES

## BACKEND SYSTEMS, API INTEGRATION & RELIABILITY ENGINEER

Email: contact.arazvera@gmail.com | Public engineering portfolio

### PROFESSIONAL SUMMARY

Backend engineering and systems-integration portfolio focused on predictable failure handling, durable event processing, transactional data integrity and testable handover. ARAZVERA builds reusable Python modules and adapts them to a client's authorized systems, data contracts and acceptance tests. Evidence below is based on runnable public implementations; no commercial production deployment is implied.

### CORE ENGINEERING EXPERTISE

**API and backend engineering** Python; FastAPI/Pydantic private starter; REST/JSON contracts; scoped tenant boundaries; request validation and negative-path tests.

**Reliability and recovery** HMAC-verified webhooks, idempotent intake, SQLite-backed job state, atomic claims, bounded retry/backoff, dead-letter review and audit trails.

**Data integrity and delivery** CSV/SQLite reconciliation, transactional dry-run, version conflicts, quarantine, rollback, GitHub Actions, Docker smoke checks and documented release gates.

### FEATURED PROJECT 06 | RESILIENT WEBHOOK & JOB RECOVERY LAB

**Problem** Duplicate events, tampered webhooks, competing workers and ambiguous external side effects can corrupt business workflows.

**Implemented** Localhost HTTP ingestion with timestamped HMAC-SHA256; tenant-scoped IDs; durable SQLite records; atomic leasing; backoff and bounded retries; dead-letter queue; manual resolution and auditable state transitions. External CRM behavior is mocked.

**Verified outcome** 16 automated tests: signature tampering/staleness, cross-tenant denial, replay conflicts, concurrent intake/claims, persistence after restart, expired leases and uncertain-outcome quarantine.

Source code | Automated tests

### FEATURED PROJECT 07 | ATOMIC DATA RECONCILIATION & SAFE IMPORT LAB

**Problem** Repeated imports, stale revisions, malformed records and partial failures can silently damage inventories and reporting data.

**Implemented** Bounded CSV intake and SQLite transactions; no-write dry-run; tenant/source isolation; batch SHA-256 receipts; idempotent replay; revision-aware conflict detection; quarantined rejects and atomic rollback.

**Verified outcome** 21 automated tests: injected mid-batch rollback, five-way concurrent batch replay, stale/duplicate revision handling, malformed CSV, durable reopen and privacy-safe audit records.

## REUSABLE ENGINEERING DELIVERY MODEL

We prepare isolated starter modules, executable examples, tests and handover templates before a contract. For each client engagement we then: (1) define scope and authorization, (2) map their API/data contracts, (3) configure least-privilege credentials in client-owned infrastructure, (4) reproduce failure modes and run acceptance tests, and (5) deliver documented rollback and handover steps. This reduces repeated setup work; it does not guarantee a fixed delivery time or pre-approve an unknown environment.

## OTHER VERIFIED EXAMPLES

Five independent public prototypes provide smaller reference cases: tenant-scoped notes, lead queue and retry, review-first text intake (mock), mocked API integration/HMAC, and Docker configuration readiness. Together they have 10 tests. The separate private Level 2 engineering starter also passed 16 automated tests and an isolated Python 3.12 Docker smoke job; private source and customer templates are not published.

## VERIFICATION & TECHNICAL EVIDENCE

- Public: 7 runnable examples; 47 automated tests passed in both Python 3.11 and Python 3.12 GitHub Actions on 9 November 2026 (10 basic + 16 webhook + 21 reconciliation).
- Private Level 2: 16 tests recorded separately, plus isolated Python 3.12 Docker runtime checks; no customer production test or production SLA.
- Historical Level 1: 172 passing recovery tests across four separate private kits. These figures are NOT added to Level 2 performance claims.

Public CI run (both Python versions) | Detailed evidence

## ENGINEERING SERVICES AVAILABLE FOR CONTRACT

**Backend and integrations** Bounded Python/FastAPI endpoints, API adapters, authorized service-to-service integration, signed webhook ingestion and existing backend repair.

**Reliability and data** Retry/queue recovery modules, idempotency hardening, controlled CSV import/reconciliation, data-quality validation and audit-friendly failure handling.

**Engineering handover** Regression tests, GitHub Actions checks, sandboxed Docker packaging, documentation, scope-specific installation and restore planning.

## CLIENT-SPECIFIC WORK STILL REQUIRED

Real projects need written requirements, lawful account/API access, customer-provided hosting or paid services where needed, security/privacy checks, identity management, load/recovery tests and acceptance sign-off. Demonstrations use synthetic data and local/mock integrations. Self-hosted n8n production deployment remains separately blocked pending vendor-supported security clearance. No AI video rendering, GPU-heavy model training, unsupported paid APIs or unlicensed platform access is offered.

## CONTACT & PORTFOLIO

contact.arazvera@gmail.com | Public GitHub portfolio | Level 2 service proof matrix

Level 2 is an internal project-scoping tier, not an external certification or guaranteed fee bracket.
