ARAZVERA TECHNOLOGIES

ENGINEERING CAPABILITY SHEET | Python • FastAPI • API Integration • n8n Workflows • Docker

What we can deliver under a scoped client contract

REST APIs and tenant-aware backend prototypes; webhook lead intake; authorization and consent-first text workflows; signed API connections; deterministic mock integrations; Docker staging, automated tests and technical handover.

Five reusable foundations

- **Multi-Tenant API Platform** — Tenant-scoped Python/FastAPI backend for data-driven workflows.
- **Reliable Lead Automation** — Controlled webhook intake and review pipeline.
- **Secure AI Intake Assistant** — Review-first categorization for service requests.
- **Universal API Integration Starter** — Resilient integration between approved business systems.
- **Docker & Delivery Toolkit** — Reproducible staging checks, health and recovery procedures.

Evidence

Level 1 baseline: 172 passing tests (four recovered private kits). Level 2 private prototypes and generator: 11 passing tests. Five independent public sample demos: 10 passing unittest cases. Both Level 2 GitHub Actions pipelines reported success. Counts are separate, development-only and not a production reliability guarantee.

Delivery boundaries

These are synthetic prototypes. Real customer integrations, enterprise identity and secrets, approved AI provider, n8n vendor licensing, supported runtime image, security/penetration review and customer acceptance must be completed separately. n8n self-hosted production release is blocked pending security acceptance.
