ARAZVERA TECHNOLOGIES

LEVEL 2 | ENGINEERING PORTFOLIO & SERVICES

Client-ready starting points, not pre-approved client deployments. Level 2 is an internal development category, NOT a professional certificate.

HOW WE HELP

We design and deliver scoped Python / FastAPI backends, REST and webhook integrations, error-resistant automations, review-first text systems and reproducible development environments. Engagements emphasize verified test contracts, explicit customer ownership and accountable handover.

ENGINEERING EVIDENCE

Workstream	Verified evidence (separate counts)
Level 1: four private kits	172 passing local tests in restored private repositories.
Level 2: five private prototypes + generator	11 passing local tests; private GitHub Actions tests and dependency review passed.
Level 2: five public standalone samples	10 Python unittest cases passed; public GitHub Actions also passed.
n8n demo	Actual local n8n-to-FastAPI demo: 5/5 synthetic HTTP scenarios passed in isolated environment; private video only.

WHAT VERIFIED DOES NOT MEAN

No evidence above proves production uptime, customer acceptance, government certification, model training or every third-party integration. The self-hosted n8n engine security gate remains BLOCKED. The isolated experiment is not a customer-approved runtime. Contact us for a precise project-specific acceptance plan.

SERVICE CATEGORIES

- FastAPI backend development and API modernization
- Synthetic-to-real webhook and lead automation (under contract)
- Secure text intake and approval workflows using approved AI providers
- API integration, HMAC, retries and operational error mapping
- Docker staging, test automation, documentation and delivery preparation

FIVE ENGINEERING PROJECTS | I–III

01 / Multi-Tenant API Platform

Tenant-scoped Python/FastAPI backend for data-driven workflows.

Implemented in private prototype: tenant data separation, synthetic role-based access, validation, pagination, idempotent writes, audit and rate control.

Public sample: independent in-memory tenant-isolated notes (2 unittest passes).

Before production: Real identity integration, schema, migrations, review of authorization boundaries, database capacity and customer staging.

Public runnable sample

02 / Reliable Lead Automation

Controlled webhook intake and review pipeline.

Implemented in private prototype: SQLite idempotency, mock CRM, retry and dead-letter behavior, review gates and metrics.

Public sample: synthetic lead queue and retry states (2 unittest passes).

Before production: Customer CRM, scheduling, broker/queue durability, webhook credentials, monitoring and legal data-retention terms.

Public runnable sample

03 / Secure AI Intake Assistant

Review-first categorization for service requests.

Implemented in private prototype: mock provider, role isolation, consent-controlled redacted history, manual approval and error fallback.

Public sample: deterministic local classification rules (2 unittest passes).

Before production: Explicitly NO trained AI model or real provider connected; requires approved vendor, DPA and consent policy.

Public runnable sample

FIVE ENGINEERING PROJECTS | IV–V

04 / Universal API Integration Starter

Resilient integration between approved business systems.

Implemented in private prototype: signed mock webhooks, replay defense, bounded timeout/retry/backoff and two mock adapters.

Public sample: HMAC demonstration, inventory and CRM mock transports (2 unittest passes).

Before production: Review each external API contract, secrets handling, rate limits, customer credentials and security acceptance.

Public runnable sample

05 / Docker & Delivery Toolkit

Reproducible staging checks, health and recovery procedures.

Implemented in private prototype: exact-image format checks, SQLite backup/restore integrity and locally bound Compose example.

Public sample: digest validation and optional standalone health-server container definition (2 unittest passes).

Before production: Vendor image pinning, TLS, full container smoke and disaster-recovery rehearsal on customer infrastructure.

Public runnable sample

REAL n8n DEMONSTRATION — WITH BOUNDARIES

A two-minute demonstration was built from actual isolated n8n editor and FastAPI test execution, with fabricated lead-intake requests. Verified HTTP cases: 201 created, 200 duplicate, 422 invalid, 202 review, 503 controlled failure. The video is stored privately; a public-viewing link has not been confirmed, so no public URL is represented here.

The separate eight-node inactive n8n workflow-only kit can be customized under contract. It does NOT include the n8n engine. Commercial hosting, Cloud account selection, vendor license acceptance, credentials, security scans and actual live E2E are customer-specific.

DELIVERY SEQUENCE

1. Scope, risk and fixed acceptance criteria
2. Choose private customer-owned instance and written permissions
3. Adapt reusable code without exposing private source
4. Unit/integration/auth/failure tests with synthetic data
5. Customer staging, credentials, security, backup/restore and monitoring
6. Client acceptance, rollback plan and documented handover

ENGAGEMENT & COMMERCIAL TERMS

ARAZVERA is available for scoped remote international engineering contracts. Final pricing and schedule depend on specifications, external services, security and deployment review. Hosting, VPS, API accounts, credentials and software subscriptions should be held by the customer. Payment may be agreed in USDT where legally and contractually permitted; no payment method is guaranteed for every platform or jurisdiction.

EVIDENCE-DRIVEN ACCEPTANCE

The public repository contains five independent runnable synthetic samples, each with an English README, `python demo.py` command, built-in unit tests and example JSON output. Their private counterparts are more complete but not open-source. Build pipelines test the public samples and examine repository contents and history for basic credential indicators. This is not a substitute for external security audits.

CUSTOMER-SPECIFIC GO-LIVE GATES

- Approved technical requirements and contract
- Real integration access, tenant permissions and secrets management
- Current dependency and image security checks
- Live staging test cases, retry and duplicate resilience
- Customer-owned backup, restore, monitoring and rollback
- Explicit license/owner/customer deployment signoff

PUBLIC CODE & CONTACT

Portfolio and runnable samples

contact.arazvera@gmail.com

No customer records, real API keys, private code bundles, internal security details or recovery archives are disclosed in public deliverables.
