LEVEL 7

Three independently engineered product laboratories

Three independent offerings. No AERON integration. No customer deployment claimed.

ARAZVERA TECHNOLOGIES develops private-source, customer-adaptable Python engineering modules. These products target supplier-evidence consistency, AI tool authorization decisions and verified SQLite recovery. They are small, tested building blocks - not turnkey enterprise platforms.

PRODUCT OVERVIEW

01 | Supplier Evidence Network | v0.2.0 LAB

Tenant-scoped supplier record import, QA findings, human review, authenticated localhost API.

02 | AI Agent Security Control | v0.1.0 LAB

Deny-by-default policy, per-tool budget, human approval and audit; no real tool execution.

03 | Recovery Evidence Orchestrator | v0.1.0 LAB

SQLite transactional snapshot, SHA-256 and integrity checks, safe local test restore.

ENGINEERING EVIDENCE

- 43 Windows Python 3.12 tests passed across the three laboratory modules.
- Four private GitHub Actions jobs passed on Ubuntu/Windows with Python 3.11/3.12.
- Independent source ZIP extraction tests: 20 supplier v0.2, 10 agent, 9 recovery.
- Temporary real loopback supplier API smoke tested 401 unauthorized, 201 import and tenant separation.

DELIVERY PRINCIPLES

Buyer-owned infrastructure and APIs. Testable written acceptance. No private source transfer, certification or binding price without rights and legality review. Contractor genuinely resident in Iran; written-only asynchronous English, no audio/video calls.

01 / SUPPLIER EVIDENCE

ARAZVERA-L7-SUPPLIER-EVIDENCE-NETWORK-001 / v0.2.0

LAB_VERIFIED / Independent supplier data QA building block

CUSTOMER PROBLEM

Supplier inputs may contain duplicated IDs, absent document references and inconsistent data before entering an existing ERP or Digital Product Passport integration. Supplier Evidence Network aims to test and review those source records with traceable human decisions.

WORKING CAPABILITIES

- Local CSV/JSON operator ingestion; SQLite persistent records and import identity.
- Tenant-scoped request idempotency, conflicts on changed retries, and findings.
- Human reviewer decisions, blocked approvals with unresolved findings, audit events.
- Optional FastAPI HTTP with server-controlled keys associated with tenant and role.
- Strict rejection of missing keys and unauthorized cross-tenant record reads.
- 20 focused tests passed after fresh private ZIP extraction; real localhost HTTP smoke passed.

NOT YET INCLUDED

Real supplier identity, live SAP/ERP connector, EC DPP registry, official Battery Passport validation, enterprise IAM/OIDC, hardened public HTTPS deployment, PostgreSQL cluster, compliance audit, customer SLA or signed buyer acceptance.

BOUNDED COMMERCIAL SCOPE

A paid synthetic input-schema adapter, import-reconciliation regression test, or independently licensed limited source component after legal eligibility and IP review. The customer's production integrations would be separately scoped.

Not a rebranded Level 6 offline battery checker: Level 7 adds durable tenant-scoped records, review state, idempotency, audit and authenticated local HTTP. Production scale remains unverified.

02 / AI TOOL GOVERNANCE

ARAZVERA-L7-AGENT-SECURITY-CONTROL-001 / v0.1.0

LAB_VERIFIED / Offline policy decision module

CUSTOMER PROBLEM

Automated AI systems need deterministic authorization decisions before invoking sensitive tools. A policy kernel can independently evaluate whether a specific agent/tool request is allowed, requires review, or must be denied.

WORKING CAPABILITIES

- SQLite-persistent per-tenant, per-agent and per-tool policy settings.
- Deny-by-default behavior when policy is absent.
- Transaction-bound usage budget accounting and changed-request replay rejection.
- Human pending, approval and rejection outcomes with budget re-evaluation.
- Traceable local decision events and command-line operation.
- 10 focused tests passed from a fresh independent private source archive.

NOT YET INCLUDED

Verified reviewer identity, OIDC/SSO, real model or tool invocation, live MCP gateway, secure remote network/API, integration with existing customer identity provider, sandboxing, threat-model verification or production certification.

BOUNDED COMMERCIAL SCOPE

A paid adaptation of the decision engine behind the buyer's existing authenticated tool gateway, with policy schema, negative-path tests and written acceptance. Source rights and deployment are separately agreed.

No AERON software, server, API or Brain connection is included or planned.

03 / RECOVERY EVIDENCE

ARAZVERA-L7-RECOVERY-ORCHESTRATOR-001 / v0.1.0

LAB_VERIFIED / Single-host SQLite recovery proof

CUSTOMER PROBLEM

Possessing a backup file does not prove that it is readable or recoverable. The current laboratory module produces an auditable backup receipt and exercises restoration into a new isolated local database.

WORKING CAPABILITIES

- Consistent SQLite backup through the native SQLite backup API.
- Snapshot metadata, SHA-256 checksum and SQLite integrity verification.
- Path and checksum rejection for tampered or substituted snapshot content.
- Restore planning without mutation and refusal to overwrite an existing target.
- Safe single-host restoration into a new local file; integrity re-check.
- 9 focused tests passed after fresh private ZIP extraction.

NOT YET INCLUDED

Multi-site replication, PostgreSQL PITR, Kubernetes orchestration, automatic failover, multi-host fencing, ransomware-resistant vault, encryption/escrow, production RPO/RTO, regular scheduled operations or an independently validated disaster-recovery SLA.

BOUNDED COMMERCIAL SCOPE

Recovery test harness, written runbook and buyer-specific failure fixtures for an authorized small SQLite project. Expanding to PostgreSQL or multi-host would require separate engineering and production acceptance.

ENGAGEMENT & ACCEPTANCE

Proof first. Private source protected. Buyer-specific delivery.

A RESPONSIBLE PROJECT START

- Identify a funded, precise failure mode and responsible technical reviewer.
- Use synthetic or lawfully supplied sample interfaces; establish written acceptance tests.
- Document source licence, nonexclusive vs OEM/assignment rights and third-party code notices.
- Confirm permitted contracts, sanctions/export, data handling and payment for an Iran-resident supplier.
- Buyer supplies and pays directly for necessary server, API, domain and software licences.
- Deliver through English asynchronous written communication only; no voice/video interviews.

WHAT THE CURRENT PRODUCTS ARE NOT

They are not complete enterprise deployments. No regulator/industry certification, security audit, actual customer production reference, signed sale, externally verified market price or live platform integration is claimed. The current laboratory source is maintained privately; public documentation does not include code.

POSSIBLE COMMERCIAL ROUTES

Small paid synthetic pilot | limited nonexclusive source licence | customized customer integration | separately quoted support. The historic aspiration for high-value enterprise contracts is not an established valuation of these prototypes.

NEXT VERIFICATION GATES

- Supplier: real authorized system adapter, production IAM, PostgreSQL, security and scale review.
- Agent: authenticated boundary, actual customer gateway integration and attack testing.
- Recovery: authorized multi-host / database target, real recovery drills and clear RPO/RTO evidence.
