ARAZVERA TECHNOLOGIES

Technical Engineering Profile

Python | FastAPI | PostgreSQL | API Integrations | Reliability | Test Engineering

Public professional capability profile - 11 November 2026

Engineering focus

Designing scoped, independently testable backend components with clear inputs, authorization boundaries, deterministic failure handling, security-oriented negative tests and written technical handovers. The engineering portfolio uses synthetic cases, local laboratories and CI proof - it is not a record of client production installations.

Core capabilities

- **Backend and API engineering:** Python, FastAPI, signed requests, RS256/JWKS lab contracts, PostgreSQL tenant-boundary tests, validation and versioned updates.
- **Reliable integrations:** durable queues, transactional outbox, authenticated webhooks, bounded retries, idempotent reconciliation and error reporting.
- **Delivery and operations:** GitHub Actions, Docker, staged release gates, canary/HOLD/rollback rehearsal, health checks and database restore exercises.
- **AI-tool safety:** deny-by-default execution gates, quotas, review controls, scoped MCP tests and evidence journals.
- **Data and evidence QA:** supplier records, synthetic CRA/DORA triage, cross-source validation and controlled SQLite recovery.

Selected laboratory evidence

Workstream	Recorded evidence
Public backend case studies	9 runnable synthetic examples; 75 public automated tests
Level 3 and 4 specialist libraries	10 private repositories with successful CI in the reported checkpoint
Level 4 resilience lab	129 local tests, staged Docker and outage acceptance exercises
Level 5 agent control labs	158 distinct local tests across four suites; 13 SKU entries
Level 6 pilot modules	146 tests in latest current pilot documentation
Level 7 adaptable modules	82 local tests, 71 clean-extraction retests, four hosted CI jobs

These test counts have distinct scopes; they are not proof of certification, customer delivery or enterprise production support.

Delivery approach

Written requirements -> testable scope -> synthetic preview -> authorized buyer integration -> security and staging acceptance -> agreed documentation and handover. Customer supplies/authorizes its own hosting, APIs, licences and secrets.

Important limitations

Level 1-7 are internal portfolio categories, not diplomas or external ratings. No live industrial/regulatory connections, official legal compliance, customer testimonials or enterprise uptime commitments are claimed. All freelance products remain independent of AERON and unrelated Iran-specific projects.

The owner is based in Iran; legal contracting, source rights, export/sanctions, customer data and lawful payment must be validated. Communications and proposals are **asynchronous written English only**.
