ARAZVERA TECHNOLOGIES

Yashar Rastgookhiavi | Python / FastAPI • Automation • API Integration • Docker

Remote engineering & reusable delivery kits • contact.arazvera@gmail.com • Public portfolio

ENGINEERING PROFILE

Prebuilding testable backend and automation components for fast, scoped client customization—not claiming one-size-fits-all production deployments. Focus: Python/FastAPI services, secure text workflows, HTTP integrations, n8n workflow design, Docker packaging, acceptance tests, and private Git-based recovery.

172	16	10
Level 1 verified pytest passes	Level 2 private pytest passes	Level 2 public demo passes

LEVEL 1 | PROVEN REUSABLE FOUNDATION

FastAPI Starter — API and backend acceptance baseline; 16 passing tests.

Kit Manager — Project generation, recovery and validation; 25 passing tests.

n8n Workflow Kit — Inactive workflow-only handoffs and tested client-safe templates; 118 passing tests.

Text Assistant — Secure text-automation core; 13 passing tests.

LEVEL 2 | FIVE PREBUILT PROJECTS FOR RAPID CLIENT TAILORING

01 Multi-Tenant API Synthetic tenant-scoped API; extend for the client's identity, storage and authorization model.

02 Reliable Lead Automation Synthetic intake, deduplication and bounded retry; connect approved CRM/webhooks.

03 Secure AI Intake Mock AI-provider interface and human-review boundary; add customer-approved model and data policy.

04 API Integration Starter Signed-request/HMAC patterns and two simulated connectors; adapt to vendor APIs.

05 Docker Delivery Toolkit Container health and isolated build/run checks; adapt deployment to client infrastructure.

DEMONSTRABLE ENGINEERING EVIDENCE

- Level 1: 172 passed across four independently restored private kits (16 + 25 + 118 + 13). This is a historic test snapshot, not a client-production certification.
- Level 2: 16 private automated tests; five independent public runnable demos with 10 passing tests. CI and dependency checks are recorded in GitHub Actions.
- Docker Delivery: exact Python 3.12 Dockerfile built and run in private GitHub CI; networkless, non-root, read-only container; HTTP 200 health and 404 negative checks.
- n8n → FastAPI: real local editor/workflow demonstration with synthetic HTTP cases. Video exists privately; no verified public playback link.

DELIVERY MODEL & BOUNDARIES

For each engagement: clone a private project starter → customize customer APIs, workflow logic and permissions → validate with client-specific test cases → document deployment, monitoring, recovery and handover. Customer infrastructure, API accounts and go-live approval remain under customer control.

Scope limitation: These are tested engineering templates, not five approved customer-production systems or a formal Level 2 certification. Self-hosted n8n engine deployment remains security-gated; client-owned n8n Cloud handoffs require authorized tenant access and live verification.
