CLIENT SERVICE CATALOG / LEVEL 2

Reliable systems. Testable outcomes.

Secure Python APIs / PostgreSQL data boundaries / Recoverable webhooks / Integration reliability

ARAZVERA TECHNOLOGIES engineers bounded backend modules that are straightforward to test, hand over and operate. We begin with a written acceptance contract and design for the failure paths that matter: unauthorized access, duplicate events, stale updates and interrupted workflows.

PUBLIC PROOF / REPRODUCIBLE SYNTHETIC CASES

08	61	03
Runnable cases	Automated tests	Advanced case studies

THREE CASE STUDIES YOU CAN INSPECT

08 / Authorized PostgreSQL API
FastAPI, offline RS256 access-token checks and active database permissions; 14 real PostgreSQL integration tests.

06 / Webhook & Job Recovery
Local HTTP/HMAC, durable queue, bounded retry, dead-letter and manual reconciliation; 16 tests.

07 / Transactional Data Reconciliation
CSV validation, atomic imports, optimistic revisioning, rollback and quarantine; 21 tests.

Private accelerators: a separate 25-family starter-kit library has 313 locally verified tests. It is NOT included in this public catalog, and these figures do not represent customer production deployments.

WHAT YOU CAN COMMISSION

Six scoped engineering packages

Every package is adapted to a defined business outcome. Final endpoint count, provider integration, schedule and commercial quote are agreed during discovery.

01 / Secure API foundation

FastAPI endpoints, request validation, signed-token integration, tenant-scoped persistence and negative-path tests.

Acceptance: cross-tenant denial, invalid-token rejection, version-safe data changes.

Public case 08 • 14 integration tests

02 / Webhook resilience

Signed event intake, durable processing, idempotent replay, bounded retries, dead-letter and review runbook.

Acceptance: duplicate-safe delivery, tested restart, visible failure recovery.

Public case 06 • 16 tests

03 / Safe data reconciliation

Validation and dry-run, quarantine, idempotent import, optimistic updates and rollback evidence.

Acceptance: no partial writes after injected failure; traceable import receipt.

Public case 07 • 21 tests

04 / API & CRM integration

Adapter contracts, schema mapping, error classification, retry/idempotency boundaries and audit events.

Acceptance: mocked provider failure tests, then authorized staging test with the client.

Public 04 mock + private starter

05 / Docker, CI & handover

Repeatable Docker setup, health checks, Python test gates, secret/history checks and recovery notes.

Acceptance: clean installation, successful automated checks, documented rollback.

Public CI + delivery sample 05

06 / Human-reviewed AI intake

Safe structured intake, confidence/exception paths, approval-before-action and configurable model adapter.

Acceptance: unknown inputs sent to human review, not executed automatically.

Public 03 rule-based mock + private starter

The packages are scoped service options, not fixed-price guarantees. Customer-controlled infrastructure and authorized API credentials are required for live integrations.

ENGINEERING EVIDENCE

What is actually verified

We separate reproducible code evidence from commercial claims. The examples below use synthetic data and local/disposable services.

A / AUTHORIZATION

RS256 access-token verification against startup-trusted JWKS; issuer, audience, time and scope checks; PostgreSQL active membership; fail-closed responses.

14 automated tests • FastAPI + PostgreSQL 16

Boundary: No hosted IdP, key-fetch lifecycle, database RLS or external TLS ingress.

B / RELIABILITY

Signed localhost HTTP intake, durable event lifecycle, lease/retry/hold states, conflict detection, dead-letter, human reconciliation.

16 automated tests • HTTP + SQLite

Boundary: Downstream CRM provider is mocked; not an active enterprise connector.

C / DATA INTEGRITY

CSV validation, dry-run, transaction-safe batch imports, revision conflicts, quarantined rows and injected-fault rollback.

21 automated tests • SQLite + CSV

Boundary: Not a real ERP migration or a managed multi-region data service.

CI, SECURITY & RECOVERY

Public GitHub Actions runs Python 3.11 and 3.12, starts an isolated PostgreSQL 16 service, runs every public demo and test, and scans files plus Git history for secrets. We make no claim of formal penetration-testing certification.

Public proof: github.com/arazvera-technologies/arazvera-engineering-portfolio/actions

Private kit evidence is separate: 25 reusable families, 30 mapped directions and 313 locally passing tests as of 9 November 2026. Those private tests are not independently runnable from the public GitHub repository.

WORK WITH ARAZVERA

From scope to accepted delivery

01 Discover Define the business outcome, data flows, authorized systems, ownership and known constraints.

02 Agree acceptance Write testable contracts: inputs, outputs, failures, access rights, documentation and milestone sign-off.

03 Implement Adapt approved components to the client environment and validate expected and negative-path behavior.

04 Verify in staging Exercise real provider behavior only with approved access; check security, retries, restoration and release conditions.

05 Handover Deliver agreed source, setup instructions, test evidence, configuration guidance and documented limits.

COLLABORATION BOUNDARIES

The client provides

Authorized infrastructure, provider accounts, access policies, domain requirements, sample data and approval of operational constraints.

We deliver against scope

Specified modules and tests, explicit error cases, source/handover package, deployment checklist and an acceptance report.

No guaranteed SLA, formal certification, unlimited scraping, payment/eligibility workaround, third-party platform control or live production integration is included without separate agreement.

LET US DEFINE A TESTABLE PROJECT

Send a short description of your workflow, systems to connect, expected users, data sensitivity and preferred acceptance outcome. We will define a bounded technical scope and a project-specific quote.
