ARAZVERA TECHNOLOGIES

LEVEL 2 — ADVANCED BACKEND & INTEGRATION ENGINEERING

Python | FastAPI | Reliable Webhooks | Data Integrity | CI & Docker
International project capability catalog — 9 November 2026

BEYOND A BASIC SCRIPT

Level 2 means building and testing the difficult boundaries between systems: duplicate events, lost acknowledgements, failed workers, stale records, tenant permissions, migrations and rollbacks. We offer **bounded engineering deliverables with real evidence**, not a claim that our reference demos are customer production deployments.

Public portfolio: https://github.com/arazvera-technologies/arazvera-engineering-portfolio
Green CI evidence: https://github.com/arazvera-technologies/arazvera-engineering-portfolio/actions/runs/42573196621

SIX ENGINEERING PACKAGES

01 | Secure Webhook Intake and Event Contracts
HMAC-SHA256 signature checks, time windows, input limits, tenant scope, repeat-event conflict handling and stable HTTP responses. **Proof:** public project 06 (real localhost HTTP). **Client-specific:** identity, secret rotation and signed provider formats.

02 | Durable Automation and Recovery
Transactional job leasing, bounded retry/backoff, dead-letter processing, manual reconciliation of unknown results and auditable status. **Proof:** project 06, 16 passing tests including competing workers and interrupted execution. **Client-specific:** real message broker, provider idempotency and operational alerts.

03 | Safe Data Migration and Reconciliation
CSV validation, transactional dry-run, batch receipts, revision-aware updates, rejected-record quarantine, atomic rollback and reproducible exports. **Proof:** public project 07, 21 tests including injected mid-batch failure and concurrent imports. **Client-specific:** real schemas, PostgreSQL migrations and customer-data policies.

04 | Python/FastAPI Backend Components
Typed REST endpoints, validation, limited access roles, tenant-aware logic, failure tests and handover. **Proof:** separately held private FastAPI starter and simple public tenant-isolation illustration. **Client-specific:** production identity provider and database security approval.

05 | CRM/API Integration and Troubleshooting
Inbound lead normalization, duplicate prevention, mock API adapters, n8n workflow troubleshooting, failure path documentation and regression tests. **Proof:** private starter, public mock examples and isolated real n8n-to-FastAPI recording. **Client-specific:** authorized APIs; vendor n8n production runtime security is currently blocked.

06 | Docker, Tests, CI and Delivery
Reproducible tests, nonroot/read-only runtime design, local health checks, GitHub Actions, backup/recovery acceptance and deployment checklist. **Proof:** seven public examples and 47 passing tests; Python 3.11/3.12 CI green; earlier private Python 3.12 synthetic Docker test passed. **Client-specific:** staging, security review and real infrastructure ownership.

WHAT WE CAN SHOW TODAY

Evidence	Verified result
Public portfolio	**7 runnable synthetic examples**
Advanced engineering	**2 tested flagship projects**
Public tests	**47 PASS**, Python 3.11 and 3.12 CI
Private Level 2 starter tests	**16 PASS**, separate from public
Historical Level 1 baseline	**172 PASS**, four private repositories
Production customer deployments	**Not claimed**
n8n self-hosted production approval	**Blocked pending vendor-security remediation**

Proof of engineering, not marketing: concurrent intake, bounded retries, HMAC tampering, cross-tenant access denial, durable storage, dry-run and hard rollback are testable in the public repository. All tests use synthetic data.

HOW A CLIENT PROJECT IS DELIVERED

1. **Scope and eligibility:** agree lawful engagement, business outcomes, budget, acceptance and failure scenarios.
2. **Architecture and access:** map customer-owned APIs, databases, permissions, rate limits and hosting.
3. **Implementation:** adapt approved private starter modules while protecting customer data and intellectual property.
4. **Acceptance testing:** verify normal and negative flows, authorization, idempotency, error recovery, transaction safety and written handover.
5. **Go-live decision:** deployment only after customer-specific security, licensing, backups, operations and explicit owner sign-off.

COMMERCIAL BOUNDARIES

Level 2 engagements generally start above US $100; each module is **quoted for the agreed scope**, not sold at a guaranteed flat fee. Cloud infrastructure, paid APIs, vendor licenses and live service costs are customer-owned or separately funded. Work from Iran proceeds **only where permitted** by applicable law, sanctions, platform policies and payment requirements; no workaround is proposed.

Excluded: generative video, GPU-heavy AI training, unauthorized account automation, paid text-to-video APIs, unsupported live voice systems, and claims of enterprise-level SLA without customer infrastructure.

THIRTY TECHNICAL SERVICES — EVIDENCE FIRST

The global Level 2 capability matrix distinguishes verified modules, private starters and work still planned (PostgreSQL migrations, OAuth/RBAC, contract testing, telemetry and customer integrations). **A planned capability is not advertised as a completed delivery.**
