YASHAR RASTGOO

BACKEND SYSTEMS & INTEGRATION RELIABILITY ENGINEER

ARAZVERA TECHNOLOGIES | Independent project contractor | Python / FastAPI / APIs / Workflow Engineering

Email: contact.arazvera@gmail.com
Public engineering portfolio: https://github.com/arazvera-technologies/arazvera-engineering-portfolio
Verified CI evidence: https://github.com/arazvera-technologies/arazvera-engineering-portfolio/actions/runs/42573196621

ENGINEERING PROFILE

I build scoped, testable backend components for teams that need more than a happy-path script. My practical focus is signed event ingestion, tenant-aware APIs, durable processing, idempotency, safe retries, data consistency, recoverability, test-driven changes and auditable handover. I use reusable engineering starters to adapt to a customer's interfaces and acceptance criteria without claiming an untested customer deployment.

SELECTED TECHNICAL WORK — RUNNABLE, PUBLIC, EVIDENCE-BASED

Resilient Webhook & Job Recovery Lab — 16 automated tests
Public source: https://github.com/arazvera-technologies/arazvera-engineering-portfolio/tree/main/projects/06_resilient_webhook_pipeline

- Built an actual localhost HTTP webhook receiver with timestamped HMAC-SHA256 signatures and tenant-bound event IDs.
- Used SQLite transactions and unique constraints for durable, atomic intake and concurrency-safe job leasing.
- Exercised bounded retries, backoff, dead-letter handling, operator reconciliation of uncertain outcomes and restart persistence.
- Tested tampering, replay conflicts, cross-tenant denial, concurrent requests, two competing workers and failure recovery.

Atomic Data Reconciliation & Safe Import Lab — 21 automated tests
Public source: https://github.com/arazvera-technologies/arazvera-engineering-portfolio/tree/main/projects/07_data_reconciliation_lab

- Implemented bounded CSV intake and a true transactional dry-run that leaves stored data untouched.
- Built batch-idempotency receipts, revision-aware updates, rejected-record quarantine and tenant/source isolation.
- Injected mid-batch failures and verified total rollback, durable reopen and five-way concurrent batch application.
- Designed safe audit outputs that omit raw rejected customer records.

Five additional independently runnable public engineering examples — 10 tests
Tenant isolation, lead queue, review-first synthetic text intake, two mock API adapters and Docker readiness checks. The public portfolio now contains **7 executable examples and 47 passing automated tests** on Python 3.11 and 3.12 CI.

REUSABLE DELIVERY CAPABILITIES

Backend & contracts: Python, FastAPI/Pydantic reference kits, REST/JSON, webhook design, request validation, SQLite/SQL prototypes, scoped access controls and API contract tests.

Resilience: at-least-once processing with idempotent intake, bounded retry/backoff, uncertain-result quarantine, manual reconciliation, data versioning, atomic import and rollback tests.

Engineering delivery: Git/GitHub Actions, automated regression testing, synthetic fixtures, isolated Docker smoke testing, recovery checklists, documented client customization and security release gates.

Workflow & AI: n8n-to-FastAPI local demonstration with real HTTP results; review-first text-intake starter with a mock AI adapter. Actual commercial provider connectivity and production n8n security sign-off remain customer-specific.

VERIFICATION — KEEPING CLAIMS PRECISE

- **47 public test cases passed** across seven examples; both Python 3.11 and 3.12 GitHub Actions jobs passed on 9 Nov 2026.
- **16 private Level 2 tests** passed in a separate engineering starter repository; a synthetic Python 3.12 Docker CI job also passed.
- **172 historical Level 1 tests** passed across four private starter-kit repositories. These counts are separate and are not production uptime, certification or commercial-customer references.

CONTRACT ENGAGEMENT

Available for narrowly scoped Python/API modules, webhook and data-integration engineering, reliability repairs, test suites and documented customer handover. Work is performed remotely from Iran **only when lawful under the client's jurisdiction, sanctions requirements and platform/payment rules**. Client-owned infrastructure, API access and acceptance are agreed before live deployment. No video generation, large-model training, or unsupported paid API dependency is offered.

ARAZVERA TECHNOLOGIES — Engineering evidence before claims.
