LEVEL 07

Independent engineering products / buyer-adjustable codebases

THREE PRIVATE MODULES / NO AERON SOFTWARE INTEGRATION

COMMERCIAL-TECHNICAL POSITION

ARAZVERA offers three testable, offline-first Python foundations for a scoped, legally permitted customer pilot. These are not complete production platforms. Every buyer must confirm acceptance requirements and lawful contracting before source exchange.

Our Level7 label is an internal engineering family, not a regulatory or vendor certification. No customer revenue, formal security assessment or signed enterprise licence is claimed.

THE THREE MODULES

- 01 Supplier Evidence Network v0.3.0: versioned INDUSTRY-NEUTRAL supplier data contracts, reconciliation, human approval and local REST API.
- 02 AI Agent Security Control v0.2.0: deny-by-default tool policy, budgets, human review and two strictly allowlisted real safe text utilities.
- 03 Recovery Evidence Orchestrator v0.2.0: consistent multi-SQLite backup verification and isolated non-overwriting restore via a trusted operator CLI.

TESTED ENGINEERING EVIDENCE

- 82 local automated tests passed on Windows Python 3.12.
- 71 module-specific tests passed after fresh extraction of three private source ZIPs.
- 4/4 private hosted CI jobs passed across Ubuntu/Windows Python 3.11/3.12.
- Two independent local Docker APIs reached Healthy and passed real synthetic HTTP checks of roles, mapping, approvals and replay.

CONTACT AND SAFE DISCLOSURE

contact.arazvera@gmail.com | github.com/arazvera-technologies

Only source-free documentation is public. A buyer requires written scope, rights review and legal/payment eligibility before private source sharing.

01 / SUPPLIER EVIDENCE

ARAZVERA-L7-SUPPLIER-EVIDENCE-NETWORK-001 / v0.3.0

MULTI-SUPPLIER QUALITY GATE / INDUSTRY NEUTRAL

WHAT WORKS TODAY

- Configurable versioned JSON contracts: required fields, primitive types and numeric bounds for any reasonable vertical.
- Multi-supplier discrepancy checks, cross-supplier ID conflict warnings, idempotent imports and pinned schema revisions.
- Human-approved export, approval blocking on findings, tenant-scoped records and event audit.
- Authenticated localhost FastAPI operator/reviewer/contract-admin roles and nonroot Docker deployment.
- 37 focused tests passed on a fresh extracted source package.

BUYER CUSTOMIZATION

The buyer specifies actual data schemas, permitted supplier interfaces, ERP or DPP API contracts, retention policies, identity system and measured acceptance cases. These are not prebuilt credentials or integrations.

Not a certified Digital Product Passport issuer, EU regulatory validator, SAP integration, production OIDC/IAM deployment, or enterprise data platform.

PROPOSED CONTRACT SHAPE

A paid, bounded synthetic pre-import data quality pilot, followed only if accepted by a source licence or customer-funded deployment integration. Pricing depends on verifiable scoped work and licensed IP rights.

02 / AGENT CONTROL

ARAZVERA-L7-AGENT-SECURITY-CONTROL-001 / v0.2.0

AUTHORIZE BEFORE EXECUTION / LOCAL CONTROLLED DEMO

WHAT WORKS TODAY

- Tenant-agent-tool authorization, deny by default, quotas and reviewer approval in durable local SQLite.
- Locally bound authenticated REST API with separate admin, executor, reviewer and auditor roles.
- Two real, pure and safe text operations (SHA-256, character counting) execute after authorization.
- Payload replay checks, persistent result receipts and fail-closed unknown execution outcomes.
- 18 focused tests passed from independent source ZIP extraction.

BUYER CUSTOMIZATION

Real customer tools must be approved and explicitly registered behind the customer's verified identity provider and trusted execution boundary. Deployment requires human identity verification, TLS, secrets management and threat review.

This product does not claim to execute real MCP, email, financial, filesystem or AI-model actions safely without separate integration and acceptance.

ENGAGEMENT

A source component or customer-specific policy-gateway integration with negative-path regression tests and signed written acceptance. No unrestricted autonomous agent platform claimed.

03 / RECOVERY EVIDENCE

ARAZVERA-L7-RECOVERY-ORCHESTRATOR-001 / v0.2.0

TRUSTED OPERATOR / SQLITE BATCH RECOVERY

WHAT WORKS TODAY

- Transaction-consistent SQLite snapshots and SHA-256/integrity receipts.
- Configurable names for up to 50 trusted local SQLite sources, group manifest and preflight verification.
- Isolated restore to new targets with overwrite refusal, corrupt-archive rejection and limited rollback of newly created outputs.
- No remotely exposed restore API; the operator controls all source paths.
- 16 focused tests passed after independent source ZIP extraction.

BUYER CUSTOMIZATION

Specific production database engines, managed offsite copies, encrypted stores, scheduling, PostgreSQL PITR, cross-host failover, measured RPO/RTO and approved runbooks require a new scoped integration and customer infrastructure.

The available release is a safe laboratory recovery checker, not a substitute for a complete Veeam/enterprise DR program.

ENGAGEMENT

A bounded customer-owned restore verification job with synthetic fixtures, followed only with buyer authorisation by larger operational changes.

BUYER ACCEPTANCE

Private source protected. Customer pays for its own infrastructure.

TRUTHFUL DELIVERY / WRITTEN CONTRACTS

BEFORE A REAL CUSTOMER DEPLOYMENT

- Establish the actual workflow, responsible technical sign-off and testable acceptance conditions.
- Obtain approved test schemas or legally permitted sample data; avoid unsolicited confidential files.
- Buyer procures any hosting, identity provider, paid API or third-party licences directly.
- Confirm IP/code licensing and legal export/sanctions/payment conditions for an Iran-resident vendor.
- Write down incident, monitoring, backup, personal-data and production support responsibilities.

DELIVERY MODEL

All English correspondence, technical specification, review and acceptance is written and asynchronous, AI-assisted only for documentation. No phone, voice or video meetings.

A high-value custom enterprise contract is a future commercial thesis, not the tested value or an offered price of these three lab modules.

TECHNICAL CONTINUATION

Source-ready for a prospective bounded pilot; NOT ready for arbitrary buyer production without real integration, independent verification and approved legal engagement.
